

## ABSTRACT OF THE DISCLOSURE

An apparatus and method for an improved washing machine having a tilt-out laundry assembly. The tilt-out action is achieved by a tiltable joint between the side of the laundry assembly and front standing struts. The tiltable joint permits a laundry assembly to  
5 rotate about the front standing struts once rear struts are removed from the rear side of the laundry assembly. In use, the service person removes the rear struts, tilts the laundry assembly about the front standing struts, and then removes the laundry assembly from the cabinet.
